

Finance systems. Built to explain the business.

Stratum is a strategic-finance workspace for a synthetic B2B SaaS company. It connects an executive dashboard, a finance copilot and a monthly business review through consistent financial definitions and traceable analysis.

ONE FINANCE FOUNDATION

01 See the performance

Executive dashboard + commentary

02 Explore the questions

Finance copilot

03 Build the review

Monthly business review

THE STARTING POINT

After more than 15 years in accounting and FP&A, I wanted to put my interest in AI to work on a complete finance workflow. I built Stratum to explore how analysis and reporting could become more useful while keeping the underlying numbers accountable.

THE DESIGN CHALLENGE

A dashboard can show what changed. The next questions are harder: what drove it, which changes matter and how should they be communicated? Stratum gives each question a dedicated workflow, with finance logic that can be inspected and reused.

MY ROLE / FINANCE MODELING, BI, PYTHON APPLICATIONS AND AI WORKFLOW DESIGN

One dataset. Defined calculations. Three ways to use them.

Synthetic records represent the customer and subscription lifecycle. Two analytical paths turn those records into a recurring-revenue model, with aligned definitions and reconciliation checks across the outputs.

01 EXECUTIVE DASHBOARD

Power BI + validated commentary

02 FINANCE COPILOT

Controlled questions + evidence

03 MONTHLY REVIEW

Validated results + narrative

Delivery: Streamlit application in the Replit portfolio. OpenAI drafts language from approved facts; financial calculations remain in the finance layers.

See the result.

Understand the movement.

Give a finance leader a fast view of recurring-revenue performance, followed by a concise explanation of the changes that deserve attention.

Portfolio presentation preview / synthetic-data demonstration

HOW IT WAS BUILT

Defined measures organize ARR, MRR, growth, retention and revenue movements into a Power BI report. Filters let the viewer explore performance by business dimension.

A Python pipeline builds a finance snapshot, selects material observations and asks AI to write the headline and supporting sentence. Validation checks the response against the approved facts before it reaches the page.

VALUE TO THE FINANCE USER

A compact executive readout with a visible path back to the measures supporting each observation.

Ask a business question. Follow the evidence.

Make repeatable finance analysis available through natural-language questions, while keeping metric definitions, calculations and reporting context visible for review.

ILLUSTRATIVE QUESTION

“How did retention change this month, and which segments contributed to the movement?”

WHAT THE ANSWER SHOWS

The result and supporting breakdown, the reporting month, the metric definition and the calculation or query used to obtain it.

If the data or approved tools cannot support the question, the response says so.

01

Interpret

Translate the question into an approved analytical task with explicit period and scope.

02

Calculate

Run controlled, read-only queries or metric functions against the finance model.

03

Validate

Check the returned results and preserve the underlying evidence and definitions.

04

Explain

Use AI to communicate the supported result, with visible calculations and limitations.

Turn validated results into a management discussion.

Create a repeatable monthly review that brings performance, drivers and management commentary together around the same definitions used in day-to-day analysis.

HOW IT WAS BUILT

The reporting workflow assembles a period-specific fact pack from the finance model, checks the results and organizes them into a consistent review structure. AI drafts commentary from that evidence; the output retains the figures and context needed for review.

WHAT LEADERSHIP RECEIVES

An executive summary, recurring-revenue and retention trends, a revenue bridge and supporting observations. The package provides a consistent starting point for discussion and finance review before distribution.

REPEATABLE REPORTING FLOW

Select period > Build fact pack > Validate results > Draft narrative > Review

WHAT THE PROJECT DEMONSTRATES

Finance judgment

Revenue mechanics, retention logic and materiality translated into a useful management view.

Systems thinking

A common data foundation connected to BI, analytical tools and a repeatable reporting workflow.

Practical AI design

Language generation grounded in explicit calculations, bounded evidence and visible controls.
